

# HOW TO EMBED CONTENT IN A POST OR PAGE

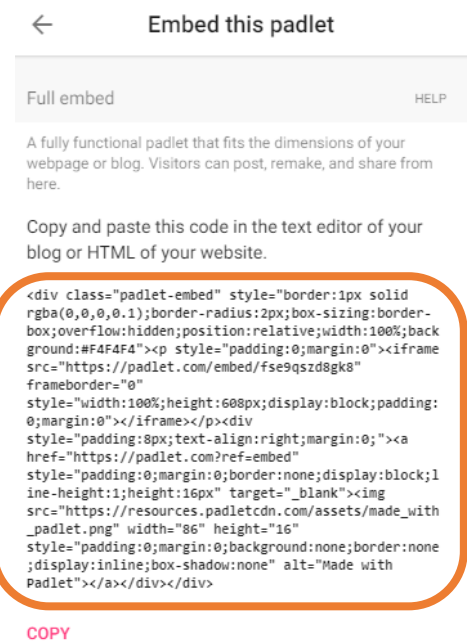

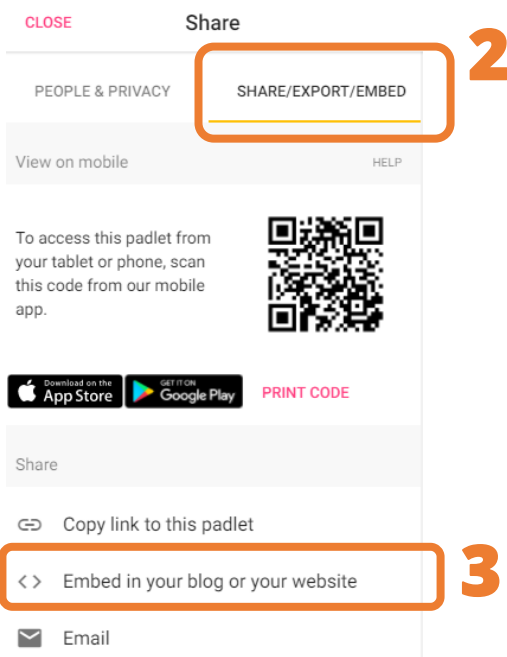

## 1. Find the embed code for the media you created or want to embed.

Websites use a range of different words or icons to represent embed code.

Look for icons like < >, the word **embed** or hover your mouse over icons until you see the word embed. Sometimes this is located under **share**.

*In Padlet, I need to click on **share** then click on **share/export/embed**.*

*I can then see the < > icons and the words **Embed in your blog or your website**.*

## 2. Copy the embed code

Look for the **HTML code** and **copy** it.

If there is a button that says **copy** then just press that. Otherwise, highlight the code with your mouse and press Control C (PC), Command C (Mac), or right click and 'copy' using your mouse.

### 3. Add the HTML code to your post (or page)

Start a new blog post or open the post you're working on.

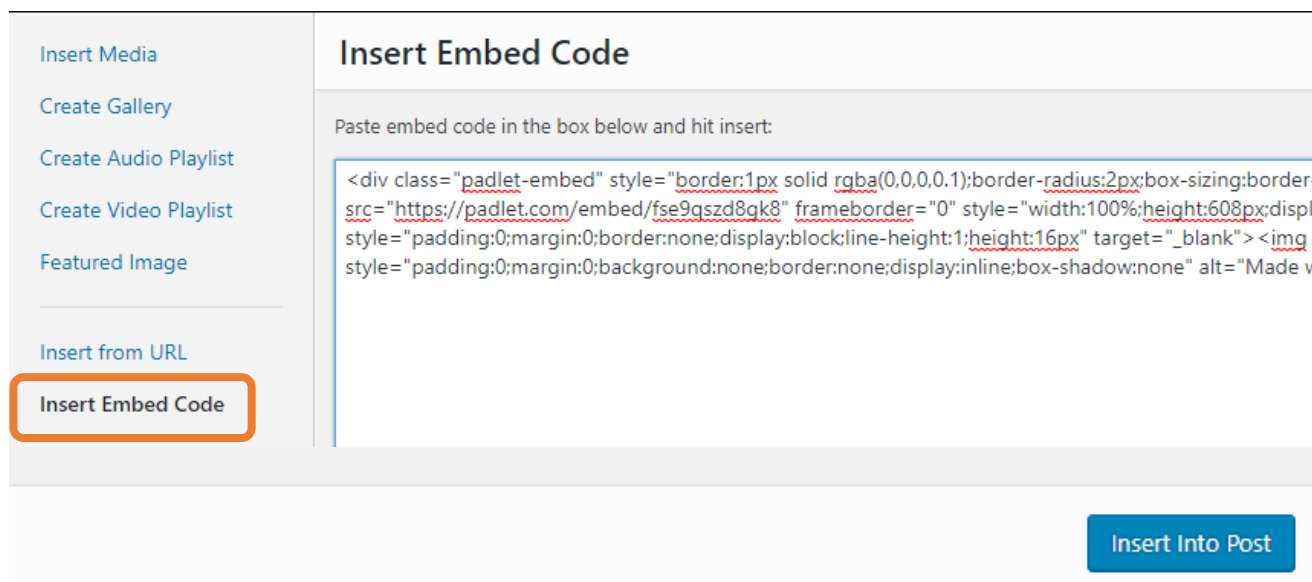

Place your cursor where you want the content to appear in your post.

Click on **Add Media**.

In the Add Media window click on the **Insert Embed Code** tab.

**Paste your code in the box** (right click paste, Control V, or Command V).

Click on **Insert Into Post**.

**Publish** your post and your content should appear. Note: it usually won't display properly while you're still in your visual editor.
